This invention describes a novel numerized anti-ras antibody-like molecule (I) that, induces apoptosis in cells with an abnormal Fas/Fas [igand system, by binding to Fas on the cell surface, and prevents apoptosis in cells with a normal system, by inhibiting binding between Fas and its ligand. The products of the invention have anti-inflammatory, anti-anemic, antidabetic, anti-allergic, anti-arthritic, antiviral, immunosuppressive, thyromimetic, antiarteriosclerotic, cardiant and hepatropic activity. (I) induce antiarteriosclerotic, cardiant and hepatropic activity. (I) induce apoptosis by binding to cell surface Fas or inhibit it by competitive confibilition of ligand binding. (I) are used to treat and/or prevent clipsus erythematosus, Hashimoto disease, rheumatoid arthritis, graft diseases associated with the Fas/Fas ligand system, especially systemic clipus erythematosus, Hashimoto disease, rheumatoid arthritis, graft oversus host disease, solorgen's syndrome, periodicus or hypoplastic anemia, Addison's disease, solorgen's syndrome, periodicus or hypoplastic anemia, Addison's disease, solorgen's syndrome, periodicus or hypoplastic anemia, Addison's disease, solorgen's syndrome, periodicus or hypoplastic cardiomyopathy, glomerulonephitis, therefore syndrome, Confidence in the molytic anemia, sterility, myasthenia gravis, multiple sclerosis, Basedow's disease, thrombopenia purpura, insulin dependent diabetes mellitus, allergy, arteriosclerosis, myocarditis, cardiomyopathy, glomerulonephitis, hepatitis (fulminat, chronic, viral (B, C or D) or alcoholic), and transplant rejection. (I) selectively (B, C or D) or alcoholic), and transplant rejection. (I) selectively chinate disease models. (I) act on the active site of Fas, i.e. they mimic cells. They bind to both human and murine Fas, so can be evaluated in murine disease models. (I) act on the active site of Fas, i.e. they mimic a human anti-murine antibody heavy chain construct designated Heu 3 munualised anti-Fas antibody pasy chain construct designated heu 3 
                                                                                                          New humanized anti-Fas antibody, useful for treating or preventing e.g. inflammatory or autoimmune disease, induces apoptosis selectively in cells with abnormal Fas-Fas ligand systems
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention describes a novel humanized anti-Fas antibody-like
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       100.0%; Score 246; DB 21; Length 470; 42.5%; Pred. Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

This invention describes a novel numanized anti-Fas antibody-like molecule (I) that, induces apoptosis in cells with an abnormal Fas/Fas ligand system, by binding to Fas on the cell surface, and prevents completely and the normal system, by inhibiting binding between Fas and its ligand. The products of the invention have anti-inflammatory, anti-antidabetic, anti-allargic, anti-arthritic, antiviral, immunosuppressive, thyromimetic, antiviral, inflammatory dermatological, immunosuppressive, thyromimetic, antiviral, inflammatory of inflamed binding to cell surface Fas or inhibit it by competitive apoptosis by binding to cell surface Fas or inhibit it by competitive apoptosis by binding to cell surface Fas or inhibit in by competitive (disease associated with the Fas/Fas ligand system, especially systemic disease associated with the Fas/Fas ligand system, especially systemic disease, sjorgen's syndrome, pernicious or hypoplastic canemia, Addison's disease, soleroderma, Goodpasture syndrome, Confuse and disease, soleroderma, Goodpasture syndrome, confused and appearance of thibit apoptosis and promal calls but selectively induce it in abnormal cells. They bind to both human and murine Fas, so can be evaluated in murine disease models. (1) act on the active site of Fas, i.e. they minic cells. They bind to both human and murine Fas, so can be evaluated in murine disease models. (1) act on the active site of Fas, i.e. they minic inducing a human anti-murine antibody response. This sequence represents a humanised anti-Fas antibody heavy chain construct designated Heu I symbol to the method of the invention.
                                                                                                                                                                                                                                                                                                                        infilamentsed anti-ras antibody, useful for treating or preventing e.g. infilamentory or autoimmune disease, induces apoptosis selectively in realist with sharement or a selectively in the sharement or a selective in the sharement of the selective in the sharement of the selective in the sharement of the selective in the selective in

This invention describes a novel humanized anti-Fas antibody-like
molecule (I) that, induces apoptosis in cells with an abnormal Fas/Fas
ligand system, by binding to Fas on the cell surface, and prevents
apoptosis in cells with a normal system, by inhibiting between
CC fas and its ligand. The products of the invention have anti-inflammatory,
anti-anemnic, antidiabetic, anti-allergic, anti-arthritic, antiviral,
immunoamodulatory, dermatological, immunosuppressive, thyromimetic,
antirheumatic, nephrotropic, antiinfertility, neuroprotective,
antiphosis by binding to cell surface Fas or inhibit it by competitive
apoptosis by binding to cell surface Fas or inhibit it by competitive
inhibition of ligand binding. (I) are used to treat and/or prevent
diseases associated with the Fas/Fas ligand system, especially systemic
lupus erythematosus, Hashimoto disease, rheumatoid arthritis, graft
versus host disease, Sjorgen's syndrome, pernicious or hypoplastic
anemia, Addisease, Siorgen's syndrome, sterility, mysathenta gravis,
multiple sclerosis, Basedow's disease, thrombopenia purpura, insulin
dependent dabetes mellitus, allergy, arterioscierosis, myocarditis,
cardiomyopathy, glomerulonephritis, hepatlitis (fulminant, chronic, viral
(B, C or D) or alcoholic), and transplant rejection. (I) selectively
                                                                                                                                                                                                                                                                                                                                                                                                   Fas; antibody; human; anti-inflammatory; anti-anemic; antidabetic; anti-allergic; anti-arthritic; antiviral; immunomodulatory; cardiant; dermatological; immunosupressive; thyromimetic; antirheumatic; anti-Fas; nephrotropic; antiinfertility; neuroprotective; antiarteriosolerotic; hepatotropic; humanized; apoptosis; systemic lupus erythematosus; hashimoto disease; rheumatoid arthritis; graft versus host disease; Sjorgen's syndrome; anemia; Addison's disease; scleroderma; sterility; Goodopasture syndrome; Crohn's disease; sterility; myasthenia gravis; multiple sclerosis; Basedow's disease; thrombopenia purpura; allergy;

ö
inhibit apoptosis in normal cells but selectively induce it in abnormal cells. They bind to both human and murine Fas, so can be evaluated in murine disease models. (I) act on the active site of Fas, i.e. they mimic the native ligand, do not induce liver disease, and have reduced risk of inducing a human anti-murine antibody response. This sequence represents a humanised anti-Fas antibody heavy chain construct designated Heu 2 which is described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     300

This is the amino acid sequence of the HV type humanised heavy chain of murine anti-human Fas monoclonal antibody HFE7A. It includes humanising R4dc and A7dr amino acid substitutions that are are conserved in the human igG heavy chain. Host Escherichia coli pyHPDHV3 SANK 70298 harbors plasmid pgHPDHV3 carrying a fusion fragment of the humanised HV type HFE7A heavy chain and DNA croding human igGl constant region (see AAV70080), and is deposited as FERM BP-6273 (claimed). The invention provides methods for producing humanised antibodies by culturing host cells. Humanised versions of HFE7A (see AAW83031-37), like native HFE7A, are capable of inducing apoptosis in abnormal cells expressing Fas, and of antibodies are used to evaluate, in onrmal cells. The humanised antibodies are used to evaluate, in animal models, treatments of diseases that involve Fas/Fas ligand interactions, and also to treat such diseases, including autoimmune disease (e.g. systemic lupus erythematosus, Hashimoto's disease, graft versus host disease, soleroderma, Goodpasture syndrome, Crohn's disease, thromatopial arthritis, autoimmune haemolytic anaemia, Sterility, myasthenia gravis, multiple scl rosis, Basedow's disease, thromatopenia purpura and insulin-dependent diabetes), allentidies, atopy, arteriosclerosis, multiple scl rosis, Basedow's disease, thromatopenia purpura and insulin-dependent diabetes), allentidies, atopy, arteriosclerosis, myocarditis, cardiomyopathy, glomerular nephritis, hypoplastic anaemia, hepatitis, AIDS and transplant rejection (all claimed).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New antibodies and proteins bind conserved epitope of Fas antigen used to evaluate drugs in animal models and to treat Fas-associated diseases e.g. autoimmune disease, allergy, atopy, arteriosclerosis, myocarditis, hepatitis and AIDS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Akio S, Hideyuki H, Hiroko Y, Jun O, Kimihisa I;

The invention relates to compositions for the prevention or treatment or diseases caused by an abnormality in the Fas/Fas ligand system containing an anti-Fas antibody as the active component. The anti-Fas antibody is either the murine anti-human Fas monoclonal antibody HFETA, or a humanised version of HFETA containing identical CDRs (complementarity determining regions) to antibody HFETA. Via its interaction with Fas, the antibody of the invention acts as a modulator of apoptosis. The compositions of the invention may therefore be used in the treatment or prevention of conditions such as autoimmune diseases, allery, atopy, arterioscierosis, myocarditis, cardiomyopathy, glomerulonephritis, aplastic anaemia (panmyelophthisis), hepatitis, AIDS represent the heavy chains (or fragments thereof) of various humanised HFETA-derived anti-Fas antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   YSNNWYFDVWGQGTLVTVSSASTKGPSVFPLAPSSKSTSGGTAALGCLVKDYFPEPVTVS 180

This interior describes a nover numerized anti-ras antibody like molecule (1) that, induces apoptosis in cells with an abnormal Fas/Fas apoptosis in cells with an abnormal Fas/Fas apoptosis in cells with a normal system, by inhibiting binding between Fas and its ligand. The products of the invention have anti-inflammatory, antidiabetic, anti-allergic, anti-arthritic, antiviral, immunosuppressive, thyronimetic, antidiabetic, antimifertility, neuroprotective, antiarteriosolerotic, cardiant and hepatropic activity. (1) induce apoptosis by binding to cells unface Fas or inhibit it by competitive inhibition of ligand binding. (1) are used to treat and/or prevent inhibition of ligand binding. (1) are used to treat and/or prevent catsors associated with the Fas/Fas ligand system, especially systemic lupus erythematosus, Hashimoto disease, rheumatoid arthritis, graft versus host disease, sjorgen's syndrome, pernicious or hypoplastic versus host disease, sjorgen's syndrome, pernicious or hypoplastic anemia, Addison's disease, rheumatoid arthritis, graft, cardiomyopathy, glomerulonephritis, hepatitis (fulminant, chronic, viral dependent diabetes mellitus, allergy, arteriosclerosis, myocarditis, cardiomyopathy, glomerulonephritis, hepatitis (fulminant, and transplant rejection. (1) selectively inhibit apoptosis in normal cells but selectively induce it in abnormal cells. They bind to both human and murine Fas, so can be evaluated in murine disease models. (1) act on the active site of Fas, i.e. they minic the native ligand, do not induce liver disease, and have reduced risk of inducing a human anti-murine anti-body HERPA designed heavy chain which is used in the method described in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New humanized anti-Fas antibody, useful for treating or preventing e.g. inflammatory or autoimmune disease, induces apoptosis selectively in cells with abnormal Fas-Fas ligand systems
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    GQGLEWMGEIDPSDSYTNYNQKFKGKATLTVDTSTSTAYMELSSLRSEDTAVYYCARNRD 120

humanised antibody

Anti-Fas humanised antibody HFE7A heavy chain.

HFE7A; monoclonal antibody; mouse; Fas;

```
care and its ligand. The products of the invention have anti-inflammatory, anti-anemic, anti-anthitic, anti-inflammatory, anti-arthritic, antiviral, immunomodulatory, dermatological, immunosupressive, thyromimetic, antiviral, immunomodulatory, dermatological, immunosupressive, thyromimetic, antiviral, cardiant and hepatropic activity. (I) induce antiarterioscierofic, cardiant and hepatropic activity. (I) induce cappetosis by binding to call surface Fas or inhibit it by competitive inhibition of ligand binding. (I) are used to treat and/or prevent casease associated with the Fas/Fas ligand system, especially systemic upus erythematosus, Hashimoto disease, rheumatoid arthritis, graft versus host disease, Solorgen's syndrome, permitious or hypoplastic upus erythematosus, alsonedwis solorgened, permitions or hypoplastic disease, autoimmune hemolytic anemia, sterility, myasthenia gravis, multiple sclerosis, Basedow's disease, thrombopenia purpura, insulin dependent diabetes mellitus, allergy, arteriosclerosis, myocarditis, cardiomyopathy, glomerulonephritis, hepatitis (fulminant, chronic, viral (B, C or D) or alcoholic), and transplant rejection. (I) selectively induce it in abnormal cells. They bind to both human and murine Fas, so can be evaluated in murine disease models. (I) act on the active site of Fas, i.e. they minic the native ligand, do not induce liver disease, and have reduced risk of inducing a human anti-murine antibody response. This sequence represents a humanised anti-mas antibody heavy chain construct designated Heu 3 which is described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

This is the amino acid sequence of the VD type humanised heavy chain of murine anti-human Fas monoclonal antibody HFE7A. E. colipgHSL7A62 SANK 73397 harbors plasmid pgHSL7A62 carrying a fusion fragment of the humanised VD type HFE7A heavy chain and DNA encoding human igGl constant region (see AAV70079), and is deposited as FERM BP-6074 (claimed). The invention provides methods for producing humanised antibodies by culturing host cells. Humanised versions of HFE7A (see AAW83031-37), like native HFE7A, are capable inducing apoptosis in abnormal cells expressing Fas, and of inhibiting Fas-induced apoptosis in normal cells. The humanised antibodies are used to evaluate, in animal models, treatments of diseases that involve Fas/Fas ligand interactions, and also to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    used to evaluate drugs in animal models and to treat Fas-associated

The invention relates to compositions for the prevention or treatment containing an anti-Fas antibody as the active component. The anti-Fas antibody is either the murine anti-human Fas monoclonal antibody HFETA, or a humanised version of HFETA containing identical CDRs (complementarity determining regions) to antibody HFETA. Via its interaction with Fas, the antibody of the invention acts as a modulator of apoptosis. The compositions of the invention may therefore be used in the tracerdient or prevention of conditions such as autoimmune diseases, allery, acopy, arterioscierosis, myocarditis, cardiomyopathy, glomerulonephritis, aplastic anaemia (panmyelophthisis), hepatitis, AIDS represent the heavy chains (or fragments thereof) of various humanised HFETA-derived anti-Fas antibodies.
                                                                                                                                                                               for the diseases caused by an abnormality
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        GOGLEWMGEIDPSDSYTNYNQKFKGKATLTVDTSTSTAYMELSSLRSEDTAVYYCARNRD 120

This invention describes a novel humanized anti-Fas antibody-like

molecule (I) that, induces apoptosis in cells with an abnormal Fas/Fas

ligand system, by binding to Fas on the cell surface, and prevents

computosis in cells with a normal system, by inhibiting binding between

Fas and its ligand. The products of the invention have anti-inflammatory,

anti-antenic, antidiabetic, anti-allergic, anti-arthritic, antiviral,

immunomodulatory, dermatological, immunosuppressive thyromimetic,

antirheumatic, nephrotropic, antiinfertility, neuroprotective,

antirheumatic, nephrotropic, antiinfertility, neuroprotective,

contianteriosclerorlic, cardiant and hepatropic activity. (I) induce

apoptosis by binding to cell surface Fas or inhibit it by competitive

antirheumatics, neither fas/Fas ligand system, especially systemic

computosis by binding to cell surface Fas or inhibit it by competitive

inhibition of ligand binding. (I) are used to treat and/or prevent

computosis by binding to cell surface Fas or inhibit it by competitive

collessases associated with the Fas/Fas ligand system, especially systemic

cupus erythematosus, Hashimoto disease, rheumatoid arthritis, graft

collessase, autoimmune hemolytic anemia, sterility, myasthenia gravis,

conflictible sclerosis, Basedow's disease, thrombopenia purpura, insulin

collessase, autoimmune hemolytic anemia, sterility, myasthenia gravis,

cardiomyopathy, glomerulonephritis, hepatitis (fulminant, chronic, viral

colls. They bind to both human and murine Fas so can be evaluated in

murine disease models. (I) act on the active site of Fas, i.e. they minic

cells. They bind to both human and murine Fas so can be evaluated in

murine disease models. (I) act on the active site of Fas, i.e. they minic

che native ligand, do not induce liver disease, and have reduced risk of

inducing a human anti-murine antibody response. This sequence represents

a humanised anti-Fas antibody HEFAS as especials. Example reference 15; Page 134-136; 263pp; English.

into interaction describes a nover inumnized anti-ras antibody-like molecule (1) that, induces apoptosis in cells with an abnormal Fas/Fas apoptosis in cells with an abnormal Fas/Fas apoptosis in cells with an operation building binding between geotosis in cells with a normal system, by inhibiting binding between fas and its ligand. The products of the invention have anti-inflammatory, anti-anemic, antidiabetic, anti-allergic, anti-arthritic, antiviral, immunomoulatory, dermanciogical, immunosuppressive, thyronimetic, antiarteriosclerotic, cardiant and hepatropic activity. (1) induce antiarteriosclerotic, cardiant and hepatropic activity. (1) induce inhibition of ligand binding. (1) are used to treat and/or prevent thinbition of ligand binding. (1) are used to treat and/or prevent systems associated with the Fas/Fas ligand system, especially systemic ulpus erythematosus, Hashimoto disease, rheumatoid arthritis, graft versus host disease, slorgen's syndrome, pernicious or hypoplastic anemia, Addison's disease, thrombopenia purpura, insulin dependent diabetes mellitus, allergy, atteriosclerosis, myocarditis, cardiomypathy, glomerulonephitis, hepatitis (fulminant, chonic, viral (8), C or D) or alcoholic), and transplant rejection. (1) selectively induce it in abnormal cells. They bind to both human and murine Fas, so can be evaluated in murine disease models. (1) act on the active site of Fas, i.e. they minic multiple a human anti-murine antibody response, This sequence represents inducing a human anti-murine antibody Hepsh heavy chain construct HHH type.
                                                                                                                        New humanized anti-Fas antibody, useful for treating or preventing e.g. inflammatory or autoimmune disease, induces apoptosis selectively in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

```
The invention relates to a compound which comprises a target cell-specific portion, comprising an humanised monoclonal antibody, having specificity for polymorphic epithelial mucin (PEM) or its antigen binding fragment and a cytoctoxic portion having endonucleolytic activity, exemplified by AAM52154-AAM52168 and encoded by ABA02682-ABA02728. The compound has cytostatic activity useful for treating cancer and acting as a potential inducer of apoptosis.
                                                                                                                                                                                                                         Humanised monoclonal antibody; polymorphic epithelial mucin; PEM1;
cytotoxic; endonuclease; DNase I; human; cytostatic; cancer; apoptosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   GQGLEWMGEIDPSDSYTNYNQKFKGKATLTVDTSTSTAYMELSSLRSEDTAVYYCARNRD 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a compound which comprises a target cell-specific portion, comprising an humanised monoclonal antibody, having specificity for polymorphic epithelial mucin (PEM) or its antigen binding fragment and a cytotoxic portion having endonucleolytic activity, exemplified by AAM$2154-AAM$2168 and encoded by ABA035682-ABA02728. The compound has cytostatic activity useful for treating cancer and acting as potential inducer of apoptosis.
                                                                                                                                                                                                                                                                                                                                                           polymorphic epithelial mucin; PEM1; I; human; cytostatic; cancer; apoptosis.

having specificity for polymorphic epithelial mucin (PEM) or its antigen binding fragment and a cytotoxic portion having endonucleolytic activity, exemplified by AAM$21184 AAM$21184 and encoded by ABA02582-ABA02728. The compound has cytostatic activity useful for treating cancer and acting as a potential inducer of apoptosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                       Humanised monoclonal antibody; polymorphic epithelial mucin; PEM1; cytotoxic; endonuclease; DNase I; human; cytostatic; cancer; apoptosis

                                                                                                                                                                                                                                                                                                      The invention relates to a compound which comprises a target cell-specific portion, comprising an humanised monoclonal antibody, having specificity for polymorphic epithelial mucin (PEM) or its antigen binding fragment and a cytotoxic portion having endonucleolytic activity, exemplified by AAM$2154-AAM$2168 and encoded by ABA02582-ABA02728. The compound has cytostatic activity useful for treating cancer and acting as a potential inducer of apoptosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                YSNNWYFDVWGQGTLVTVSSASTKGPSVFPLAPSSKSTSGGTAALGCLVKDYFPEPVTVS 180
